

## AMB Warehouse, Southern New Jersey

**The Challenge:** This warehouse building in South Jersey had deteriorated paint over asbestos transite corrugated panels on the exterior and similar paint conditions on the interior. The owner wanted the entire building to be coated with an encasement system that would waterproof the exterior of the building and provide long term protection of the asbestos panels. Over 100,000 square feet of surface area needed to be coated.

**The Solution:** The ECI Encasement system was chosen. A test patch of the system was provided prior to the start of the project. One coat of the F-50 Penetrating Stabilizer was applied, followed by two coats of the F-51 Sealer Coat. This provided the owner with the system they were looking for.
