Penn Station, Newark, NJ

The Challenge: New Jersey Transit and Amtrak were looking for a long term solution to encase the deteriorated lead-based paint on both the concrete and steel support structures throughout the overhead platform and train tracks.

The Solution: ECI's FiberTech Encasement System was chosen for all of the steel support structure and concrete surfaces due to its proven ability to successfully encase lead-based paint on similar surfaces. It was also chosen for its proven long-term durability and waterproofing capability. The FiberTech F-50 Primer and two coats of F-51 Sealer Coat were used to cover all of the lead-based paint surfaces.
